AEGISAGENT DRP

Autonomous Digital Risk Protection

A monitoring and investigation prototype for potential brand impersonation across social profiles and mobile applications. Uses registered brand assets, configurable risk signals, analyst review, and structured evidence reporting.

Detect. Review. Document. Protect Brand Trust.

Digital Brand Abuse: The Problem & Our Approach

PROBLEM & SOLUTION

Brand impersonation across social profiles and mobile apps can mislead customers, damage trust, and increase the effort required for security teams to investigate suspicious assets.

Common Threat Patterns

Look-alike Social Profiles

Profiles may imitate a brand name or support identity to mislead customers. Similarity alone does not prove malicious intent.

Needs contextual review

Suspicious Mobile Apps

Apps may use similar names or branding, or have publisher details that differ from the official brand profile.

Compare against registered assets

False Positives Matter

Legitimate brand accounts and official applications must be distinguished from suspicious candidates using the configured brand registry.

Official-asset exclusion

The AegisAgent Approach

Monitor Demo Candidates

Run social and app monitoring workflows using synthetic demonstration fixtures.

Demo fixture provenance

Evaluate Risk Signals

Assess configured name, branding, and publisher indicators to prioritize candidates for review.

Human review required

Investigate & Report

Review findings, update investigation status, and prepare structured JSON evidence.

No automatic takedowns

AegisAgent DRP demonstrates a structured workflow for evaluating potential external brand abuse without claiming live platform surveillance.

Transparent Prototype

From Candidate Signal to Investigation

WORKFLOW & FEATURES

STEP 01 **Load Candidates** → STEP 02 **Normalize Signals** → STEP 03 **Compare Brand Assets** → STEP 04 **Score & Prioritize** → STEP 05 **Review & Report**

The prototype organizes candidate evaluation and evidence review. Monitoring runs use synthetic demo fixtures; analysts review the resulting findings rather than relying on unverified automated accusations.

Look-alike Name Signals

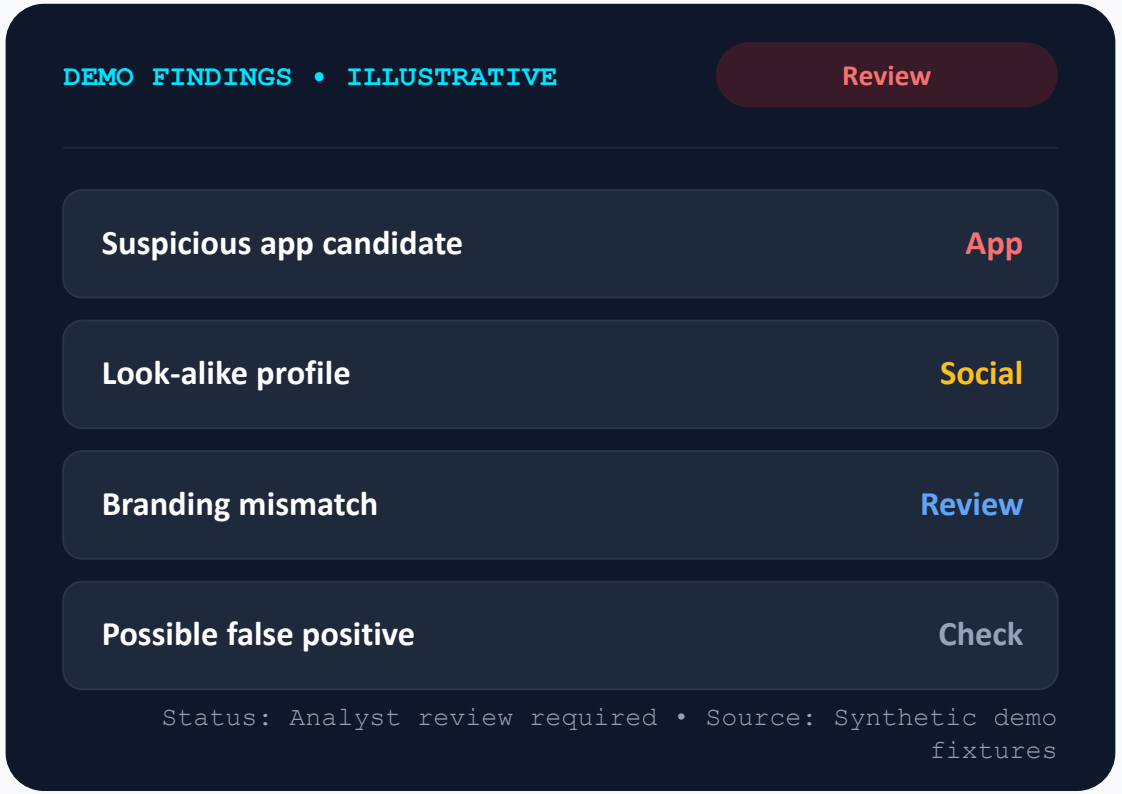

Configured checks can highlight similar names, added words, or spacing and delimiter changes. Detection quality depends on the available candidate data and rules.

Branding Indicators

Candidate branding indicators can support triage when configured. Do not interpret a similarity score as proof of impersonation.

Publisher & App Signals

App monitoring fixtures demonstrate checks such as publisher inconsistency and suspicious descriptions. This prototype does not claim to decompile live APKs.

Application Architecture & Role-Oriented Interfaces

SYSTEM ARCHITECTURE

Frontend
React · Vite

→

Backend
Python · FastAPI

→

Database
SQLite

Role-Oriented Application Areas

`/analyst` **Security Analyst**
Monitoring runs, findings, review status, evidence docket

`/legal` **Legal Workflow**
Takedown-preparation and evidence review; no external dispatch

`/support` **Customer Support**
Official-asset lookup and customer guidance workflows

`/executive` **Executive View**
Risk summaries and operational reporting demonstrations

Verification & Evidence

The API supports configured brand profiles, monitoring runs, findings, status updates, and JSON evidence reporting. Verify current endpoints in the interactive API documentation.

`API Documentation`

https://aegisagent-drp.onrender.com/docs

The Legal interface prepares review material; it does not automatically submit takedown requests to external platforms.

- ✓ Demo authentication
- ✓ Human review workflow
- ✓ Frontend and backend tests

What This Prototype Demonstrates

Capability	Current prototype	Implemented now	Future work
Monitoring	Synthetic fixtures	Social + app demo runs	Authorized APIs
Detection	Configured signals	Risk-scored findings	Measured accuracy
Investigation	Analyst workflow	Statuses + JSON evidence	Workflow integrations
Storage	SQLite	Current findings store	Durable managed DB

Technical Implementation

React frontend, FastAPI backend, and SQLite storage. Check repository scripts and current test results for exact validation status.

Responsible Triage

Risk scores prioritize review; they do not establish malicious intent. Official-asset exclusions should be validated with representative tests.

Honest Scope

The current demonstration uses synthetic fixtures. Live social/app connectors, measured detection rates, and production response SLAs are not claimed.

Deployment: Vercel frontend + Render API. Free-tier startup and ephemeral storage limitations may apply.

References, Scope & Responsible Use

RESEARCH & SCOPE

The current application is a prototype demonstrating digital risk protection workflows, not a validated production monitoring service.

Implementation Scope

Social and app monitoring demonstrations use synthetic fixtures. Detection signals and findings should be evaluated against labelled examples before making accuracy claims.

Responsible Investigation

Treat scores as triage signals, not proof. Confirm findings manually, protect evidence and credentials, and use authorized data sources for any future integrations.

Deployment Considerations

The frontend is deployed on Vercel and the API on Render. Free-tier services may sleep, and SQLite data may not persist across all restarts or redeployments.

Future Enhancements

Authorized platform APIs, scheduled monitoring, stronger similarity evaluation, production authentication and authorization, durable storage, and measured precision/recall.

Identify. Review. Document. Protect Brand Trust.

1. Open the deployed application and explore the Analyst Dashboard
2. Run the social and app monitoring demo workflows
3. Review findings, official assets, and JSON evidence

A transparent prototype for organizing the investigation of potential digital brand-abuse threats.
